

Environment

Business can only be sustainable long term, when the demands of economic, social and environmental bottom lines are balanced successfully. At Incorp, through our research, training and hands on experience we strive to be a market leader in sustainability.

Incorp has invested much time and money in its research of all aspects regarding the design, creation and running of workplace environments. In particular, our focus has been upon ways to create innovative and functional work spaces that minimise their impact on the planet and go a long way to being ecologically sustainable.

Our research has identified viable environmentally friendly alternatives for office products and procedures. The team at Incorp provide our clients with the knowledge and options to minimise their impact upon the planet.

Nabers

Nabers is a performance-based rating system for existing buildings. NABERS rates a building on the basis of its measured operational impacts on the environment and provides a simple

indication of how well you are managing these environmental impacts. Incorp Accredited Assessors are qualified to supply you with an official NABERS rating.

Greenstar

Green Star is a comprehensive, national, voluntary environmental rating scheme that evaluates the environmental design and achievements of buildings. A green workspace can address issues such as access to natural light, waste management, energy conservation, and the creation of a healthy office.

LEED

LEED is a collection of consensus based measures within the above categories which if adopted will lead to more sustainable commercial interiors, less operating costs and a more user friendly workplace with less impact on the environment.

Incorp has Green Star and LEED accredited professionals in Interior Design and Engineering, who have practical experience in Base Building and Office Interiors projects.
